

SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE		DEPARTMENT OF COMPUTER SCIENCE ENGINEERING	
Program Name: B. Tech		Assignment Type: Lab	Academic Year:2025-2026
Course Coordinator Name		Dr. Rishabh Mittal	
Instructor(s) Name		Mr. S Naresh Kumar	
		Ms. B. Swathi	
		Dr. Sasanko Shekhar Gantayat	
		Mr. Md Sallauddin	
		Dr. Mathivanan	
		Mr. Y Srikanth	
		Ms. N Shilpa	
		Dr. Rishabh Mittal (Coordinator)	
		Dr. R. Prashant Kumar	
		Mr. Ankushavali MD	
		Mr. B Viswanath	
		Ms. Sujitha Reddy	
		Ms. A. Anitha	
		Ms. M.Madhuri	
		Ms. Katherashala Swetha	
		Ms. Velpula sumalatha	
Mr. Bingi Raju			
CourseCode	23CS002PC304	Course Title	AI Assisted Coding
Year/Sem	III/II	Regulation	R23
Date and Day of Assignment	Week5 – Monday	Time(s)	23CSBTB01 To 23CSBTB52
Duration	2 Hours	Batch	Batch-46
Name	N.Jashwanth Reddy	HallTicket No.	2303A53017
Assignment Number: 10.1(Present assignment number)/24(Total number of assignments)			
Q.No.	Question	Expected Time to complete	
1	Lab 10 – Code Review and Quality: Using AI to Improve Code Quality and Readability	Week5 - Monday	

	Lab Objectives • Use AI for automated code review and quality enhancement. • Identify and fix syntax, logical, performance, and security issues in Python code. • Improve readability and maintainability through structured refactoring and comments. • Apply prompt engineering for targeted improvements. • Evaluate AI-generated suggestions against PEP 8 standards and software engineering best practices Lab Outcomes 1. Students will be able to use AI tools to review code. 2. Students will be able to improve code quality and readability. 3. Students will be able to identify and fix common coding issues. Task Description #1 – Syntax and Logic Errors Task: Use AI to identify and fix syntax and logic errors in a faulty Python script. Sample Input Code: <pre># Calculate average score of a student def calc_average(marks): total = 0 for m in marks: total += m average = total / len(marks) return avrage # Typo here marks = [85, 90, 78, 92] print("Average Score is ", calc_average(marks))</pre> Expected Output: • Corrected and runnable Python code with explanations of the	
--	--	--

	fixes. Prompt: Identify and fix syntax and logical errors in the following Python code and provide corrected runnable code. Code: <pre>def calc_average(marks): total = 0 for m in marks: total += m average = total / len(marks) return average marks = [85, 90, 78, 92] print("Average Score is", calc_average(marks))</pre>	
	Task Description #2 – PEP 8 Compliance Task: Use AI to refactor Python code to follow PEP 8 style guidelines. Sample Input Code: <pre>def area_of_rect(L,B) : return L*B print(area_of_rect(10,20))</pre> Expected Output: Well-formatted PEP 8-compliant Python code. Prompt: Refactor the following Python code to follow PEP 8 style guidelines and improve readability. Code: <pre># Function to calculate area of a rectangle def area_of_rectangle(length, breadth): return length * breadth print("Area of Rectangle:", area_of_rectangle(10, 20))</pre>	

	Task Description #3 – Readability Enhancement Task: Use AI to make code more readable without changing its logic. Sample Input Code: <pre>def c(x,y): return x*y/100 a=200 b=15 print(c(a,b))</pre> Expected Output: Python code with descriptive variable names, inline comments, and clear formatting.	
	Prompt: Improve the readability of the following Python code by using meaningful names and proper formatting without changing its logic. Code: <pre>def calculate_percentage(amount, percentage): return amount * percentage / 100 principal_amount = 200 interest_rate = 15 result = calculate_percentage(principal_amount, interest_rate) print("Calculated Percentage Value:", result)</pre> Task Description #4 – Refactoring for Maintainability Task: Use AI to break repetitive or long code into reusable functions. Sample Input Code:	

	<pre>students = ["Alice", "Bob", "Charlie"] print("Welcome", students[0]) print("Welcome", students[1]) print("Welcome", students[2])</pre> Expected Output: Modular code with reusable functions.	
	Prompt: Refactor the following repetitive Python code into reusable functions to improve maintainability. Code: <pre>def welcome_students(student_list): for student in student_list: print("Welcome", student)</pre> <pre>students = ["Alice", "Bob", "Charlie"] welcome_students(students)</pre> Task Description #5 – Performance Optimization Task: Use AI to make the code run faster. Sample Input Code: <pre># Find squares of numbers nums = [i for i in range(1,1000000)] squares = [] for n in nums: squares.append(n**2) print(len(squares))</pre> Expected Output: Optimized code using list comprehensions or vectorized operations.	

Prompt:

Optimize the following Python code to improve performance and memory efficiency.

Code:

```
nums = range(1, 1_000_000)
squares = [n ** 2 for n in nums]

print(len(squares))
```

Task Description #6 – Complexity Reduction

Task: Use AI to simplify overly complex logic.

Sample Input Code:

```
def grade(score):
    if score >= 90:
        return "A"
    else:
        if score >= 80:
            return "B"
        else:
            if score >= 70:
                return "C"
            else:
                if score >= 60:
                    return "D"
                else:
                    return "F"
```

Expected Output:

- Cleaner logic using elif or dictionary mapping.

Prompt:

Simplify the following nested conditional logic to make the code cleaner

	and more readable.	
--	--------------------	--

Code:

```
def grade(score):  
    if score >= 90:  
        return "A"  
    elif score >= 80:  
        return "B"  
    elif score >= 70:  
        return "C"  
    elif score >= 60:  
        return "D"  
    else:  
        return "F"
```
